The Journal Impact Factor (JIF) is a journal-level metric calculated from data indexed in the Web of Science Core Collection. It should be used with careful attention to the many factors that influence citation rates, such as the volume of publication and citations characteristics of the subject area and type of journal. The Journal Impact Factor can complement expert opinion and informed peer review. In the case of academic evaluation for tenure, it is inappropriate to use a journal-level metric as a proxy measure for individual researchers, institutions, or articles

Journal Citation Reports, provide quartile rankings based on rank for the Journal Impact Factor. In Journal Citation Reports, quartiles are defined as the following:

Q1	0.0 < Z ≤ 0.25	Highest ranked journals in a category
Q2	0.25 < Z ≤ 0.5	
Q3	0.5 < Z ≤ 0.75	
Q4	0.75 < Z	Lowest ranked journals in a category
